

Sudan University of Science and Technology
College of Computer Science and Information Technology
Proposal Template for Graduation Projects

A well-organized and properly structured proposal is required, ensuring all the below points follow the specified order and comply with all guidelines outlined in the Research Methodology, including formatting, numbering, and the presentation of figures and tables.

1. First page:

- University name, College name, Students names, Submission Date
- Title of the Proposal

2. Introduction/background/overview

- An overview of the project
- Introduces the background work on it.
- Also include an introduction to the industry or organization being investigated or evaluated.

3. Importance of project

- Explains **why solving the problem matters** and **how the findings will contribute**—either to theory, practice, policy, or future studies.
- Shows the **value** of your work to the academic community, stakeholders, or society.
- Highlights potential **benefits, applications, and impacts**.
- Strengthens the rationale for conducting the study.

4. Summary of previous work (with citation)

- Identifies other work, publications and research related to your topic.
- Table of comparison, such as below:

Study/Researcher Name+ Date	Objectives	Data size	Methods (tools & techniques)	Results	Opinion about the study (findings, limitations)
--------------------------------	------------	--------------	------------------------------------	---------	---

5. Problem

- This is the *specific issue, gap, or challenge* that your project aims to address.
- It should clearly state **what is wrong, missing, or unknown** in the current body of knowledge or practice.
- Focuses your study on a clear, concise issue.
- Helps design the research objectives and questions.

6. Questions or hypotheses

- A hypothesis is ‘a tentative proposition which is subject to verification through subsequent investigation’

7. Objectives

a. Aims

- Identify at the highest level what it is you hope to achieve with your project

b. Objectives

- Identify specific, measurable achievements that build towards the ultimate aim of your project.
- They are more precise than aims as they are ‘quantitative and qualitative measures by which completion of the project will be judged’.

8. Methodology

- Explains *how* you will conduct the study so that others can understand, evaluate, or replicate it.
- It focuses on **procedures, tools, data, and reasoning**—turning your project problem into a practical, step-by-step plan.

9. Expected outcomes/deliverables/contribution

- Identify precisely what you intend to submit at the end of the project.

10. Scope of project

- Clarifies **what is included** and **what is excluded** in the study.
- Helps maintain focus and avoid unnecessary distractions.

11. Project planning

- Scheduling(Gantt charts)

12. References

- Are the list of sources you used to build your study—books, journal articles, reports, websites, or any other materials you cited.
- They must match exactly with the citations used in your text.
- Only recent ones will be approved.
- Follow a specific citation style (Harvard).
